AGENDA

- 1 INSURANCE
- 2 OUR SOFTWARE
CAPABILITIES
- 3 A CASE STUDY
- 4 OUR OFFERING

INSURANCE

Insurance is normally bought with emotion; having all the available data at hand and analysing it fully is vital to most accurately understanding the underlying risks.

Where insurance is useful: in protecting you from losing future profits due to a catastrophic event.

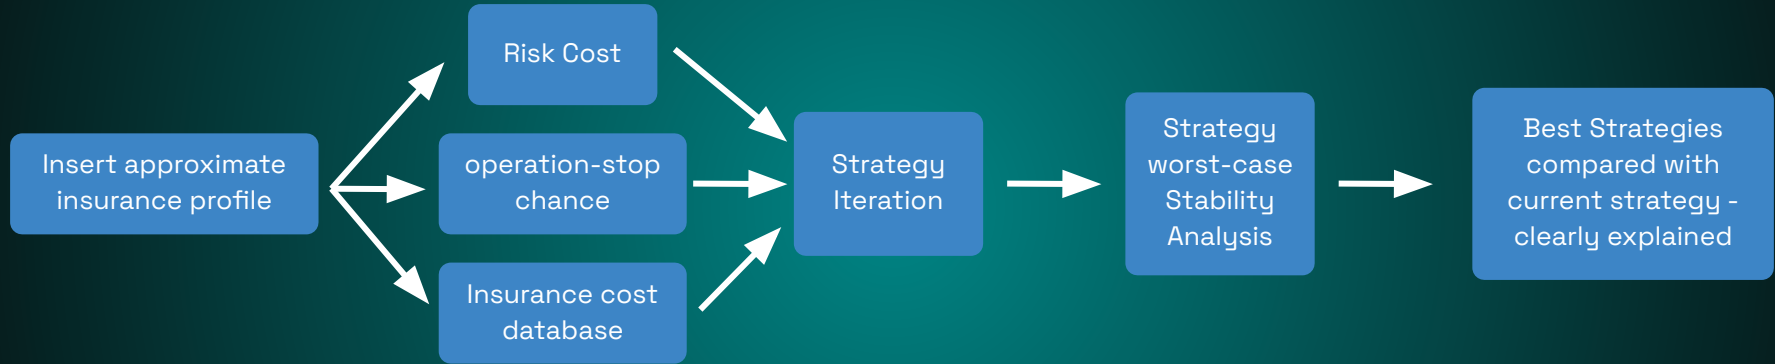

In some cases, the *certain* loss from insurance cost is more dangerous to the business than the *uncertain* risk itself.

“

Up to 95% of our thinking in purchasing decisions is emotional - that is why insurance companies make such a profit.

Data from Garland Zaltman Study
Harvard

OUR MODEL CAPABILITIES

OUR SOFTWARE CAPABILITIES

Database + Aggregation

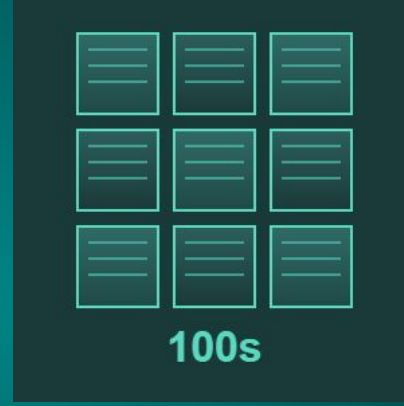

Important to understand what the real risks are:

- National, International
- Insurance margins
- Paid databases

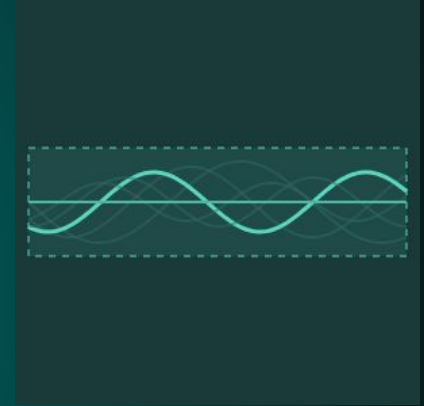

Risk Cost + Operation-Stop Calculation

Combining the risk and asset value to understand the risk cost.

Extensive Strategy Library

What options are there? We have a private database with 100s of strategies.

Stability Analysis

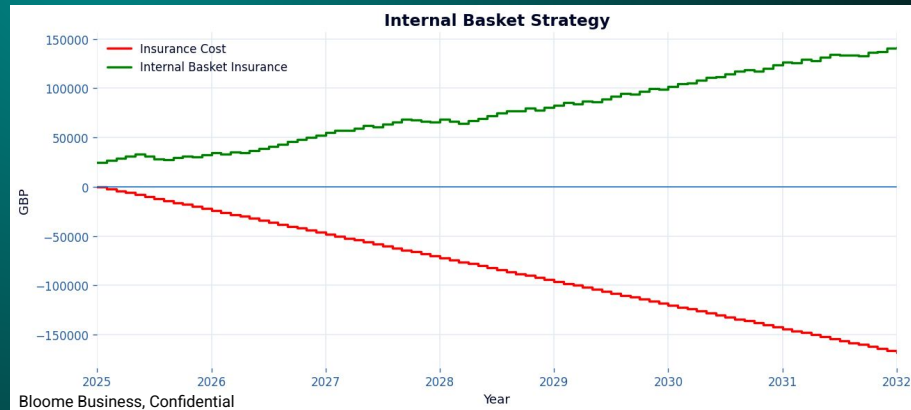

How will a given insurance strategy play out? What are the spectrum of possible outcomes?

A CASE STUDY

A London Student Accommodation

1. It was seen that the risk profile for a specific insurance allowed for "internal basket" insurance, with an initial input of £10k.
2. Initial investment taken out over the following year.
3. Invested in insurance-grade bonds (AAA). Every year they make more money off the strategic improvement.
4. Management more comfortable given the higher limits than the insurance contract offered, and less burdened with bureaucracy.

Our client now insures the identical risk, but is **making** money on it rather than **losing** it.

OUR OFFERING

1. Percent value-add based compensation for Bloome Business.
2. Once we understand the basic structure of your exposures, we can develop an exposures report with all of our ideas that add value.
3. Our processes are always explainable; we never rely on the outputs of black-box models.
